

WorldNet TPS

Sandbox Testing

Scope

This document details how to integrate to the WorldNet sandbox account. It requires familiarity with the basics of integrating with our hosts, detailed in our [Integration Guide](#). It is not intended to offer complete testing guidelines. For these please see [this document](#).

What is a Sandbox account?

A sandbox account is used to test basic integrations with our payment gateway. These accounts (one per currency) are publically available on our test host and can be used without requesting access from WorldNet TPS. They provide very basic functionality and no access to the back-end "Merchant SelfCare System".

What can you test?

Sandbox accounts provide the ability to perform basic sales & refunds through our test host with any of the three integration methods, including eDCC. For testing 3DSecure transactions, pre-authorisations, completions, SecureCard functionality, subscriptions, unreferenced refunds or any other feature or currency, you must request a full test account by e-mailing support@worldnettps.com. You can also use our [Payment Page Layout designer](#) to prepare the layout of your Payment Page before your live account is set up.

Account Details

Our test host connectivity information is available in our [Integration Guide document](#). Sandbox account details are:

Gateway	Currency	Terminal ID	Shared Secret
worldnet	EUR	6001	sandboxEUR
worldnet	GBP	6002	sandboxGBP
worldnet	USD	6003	sandboxUSD

Please note that if using the Hosted Payment Page or POST page in the live environment, you should always include the RECEIPTPAGEURL parameter, so that our host knows where to send the customer to after payment.

Test cards and responses

All test card numbers, expected responses and general testing information can be found in our [Testing Guide document](#).
